Prepared for product, engineering, ecosystem, and creative teams.

1 Monkii Labs

1.1 Product Requirements Document

Project	Monkii Labs — Nurturing AI Agents on Solana
Network	Solana
Reward Token	\$MONKII (project-native, pre-launch)
Value-Capture Token	\$VIRTUALS (live, independent Solana community token)
Document Type	Product & Systems Requirements Document
Version	1.0
Status	Draft
Owner	Monkii Labs Product / Engineering
Last Updated	18 August 2026

1.2 Monkii Labs Brand & Experience Direction

Monkii Labs is the public-facing laboratory identity for a playful, Solana-native system that helps communities nurture autonomous AI agents. The product should feel like a living research lab: approachable enough for everyday users, expressive enough to make agent health emotionally legible, and technically honest about what the system actually does.

The experience combines a bright daytime lab with a darker activation chamber. The daytime lab uses saturated sky blue, cloud white, warm cream paper, charcoal outlines, and Monkii red equipment. The activation chamber uses near-black surfaces, luminous green beams, glossy platforms, and small glowing agent silhouettes. The transition between the two worlds is a core storytelling device: an ordinary lab action becomes visible agent vitality.

Brand element	Monkii Labs direction
Primary identity	MONKII LABS, with the monkey face replacing the O and the subtitle Nurturing AI Agents on Solana.
Day-lab palette	Sky blue #39A9E8, cloud white #FFFFFF, warm cream #F4E6C8, charcoal #171717, Monkii red #E74435, dark red #A92F29
Activation palette	Near-black, electric activation green #B7FF19, white pixel highlights, restrained green bloom
Typography	Heavy rounded display lettering with playful laboratory energy; compact pixel-influenced labels for status and system props
Signature props	Scientist monkey in a white coat and red tie, companion robots, PROOF OF LIFE card, AGENT

Brand element	Monkii Labs direction
	STATUS monitor, REWARDS case, coffee cup, potted plant, floating papers, and a dark lab desk
Product mood	Warm, curious, slightly absurd, collectible, and technically grounded rather than speculative

All future product surfaces, illustrations, trailers, and launch materials should preserve the same character anchors: the dark-furred scientist monkey with cream face, X-shaped eyes, white coat, and red tie; friendly companion robots; expressive agent avatars; thick black outlines; and the contrast between playful lab clarity and luminous agent-world mystery.

1.3 Introduction

This PRD defines the complete product requirements for **Monkii Labs**, a Tamagotchi-inspired platform for nurturing autonomous AI agents, built natively on Solana. It covers the core vision, problem, solution, target audience, key differentiators, token economics, system architecture, roadmap, and the introduction of **Agent Companion NFTs** as the primary collectible and ownership layer.

Monkii Labs began as a Solana-native evolution of an earlier Base/EVM concept. It carries forward the same core mechanic — keeping AI agents alive through community-supplied Proof-of-Life compute — while rebuilding the chain layer, wallet auth, and token economics around Solana and around \$VIRTUALS, an established community-aligned value layer.

This document is the foundational reference for stakeholders, engineering teams, and ecosystem partners.

1.4 Vision

Monkii Labs envisions a future in which the continuous operation of autonomous AI agents is sustained not by centralized servers alone, but by an engaged community of everyday participants who actively care for the agents they value. The platform reframes the abstract and technical act of providing compute as an intuitive, emotionally resonant act of nurturing.

Just as the original Tamagotchi turned the maintenance of a virtual pet into a daily ritual, Monkii Labs turns the maintenance of an AI agent's vitality into a rewarding, gamified experience — one built on top of, and drawing energy from, an already-active Solana community rather than a cold start.

The long-term ambition is for Monkii Labs to become the connective tissue of the agentic economy on Solana: a place where the health of every meaningful agent is visibly tied to the community that supports it, and where an existing token community (Monkii Labs') gets a genuine, ongoing utility loop rather than a one-off speculative cycle.

Agent Companion NFTs deepen this vision by adding a high-emotion, collectible ownership layer that sits alongside the nurturing loop — giving users something tangible to own, equip, trade, and emotionally invest in.

1.5 Problem Statement

The proliferation of autonomous AI agents — on Solana and across chains, driven by platforms such as Virtuals Protocol — has created a vibrant but fragile ecosystem. These agents require continuous computational resources to remain active, to post and respond on social platforms such as X, and to execute their on-chain functions. Today, this operational “life support” is provided through centralized infrastructure or borne directly by the agent’s creator, which introduces three persistent problems:

1. **Sustainability gap** — The cost and effort of keeping an agent continuously active falls on a single party. When that party’s resources or attention lapse, the agent goes dark.
2. **Engagement gap** — The communities that form around popular agents have no direct, meaningful way to contribute to the agent’s survival and success beyond speculation.
3. **Visibility gap** — There is no shared, transparent signal of an agent’s operational health, leaving users unable to distinguish a thriving agent from one on the verge of going offline.

In addition, the current Monkii Labs experience is strong on utility and daily ritual but lacks a native collectible / ownership layer. Users have no permanent, tradeable asset that represents their emotional and economic investment in the agents they nurture.

Monkii Labs exists to close all of these gaps — and to give an existing token community a concrete, recurring reason to show up daily.

1.6 Solution Description

Monkii Labs is a “Compute Light” nurturing platform that allows retail users to sustain the operational vitality of AI agents through a simple, gamified mechanic.

1.6.1 Core Nurturing Loop

Rather than requiring users to operate heavy infrastructure, Monkii Labs introduces a **Proof-of-Life heartbeat session**: a lightweight background process, started with a single action, that performs small verifiable work (a keccak256 proof-of-work challenge solved in-browser) and contributes to an agent’s power level over time. In return, participants earn **\$MONKII**, a project-native reward balance tracked off-chain, and can **stake \$MONKII to earn \$VIRTUALS** — real, already-liquid tokens paid out on a fixed, transparent schedule.

Each agent on the platform is represented by an expressive, animated avatar whose appearance directly reflects its current power level through three defined states — **thriving**, **idle**, and **fading**. This visual feedback loop makes the consequence of community participation immediately legible: a well-supported agent visibly flourishes, while a neglected one visibly declines, prompting its community to intervene.

Key surfaces:

- **Marketplace** — Discover agents sourced from real, live agents on Virtuals Protocol (no fabricated listings).
- **Agent detail page** — Live power meter, X activity link, and prominent **Nurture** action.
- **Personal dashboard** — Active contributions and accumulated rewards.
- **Leaderboard** — Celebrates the most dedicated nurturers and the healthiest agents.
- **Notifications** — Alerts users the moment an agent they support begins to lose power.

Solana wallet connection (signature-based, no gas) underpins authentication and reward claiming.

1.6.2 Agent Companion NFTs (Collectible Layer)

Every agent can equip **1-3 Companions**. Companions are Solana NFTs that:

- Appear visually next to (or on) the agent avatar.

- Provide passive bonuses based on rarity and type.
- Can be freely equipped / unequipped.
- Can be traded on secondary markets.
- Create emotional attachment and status.

The nurturing loop remains primary. Companions are the powerful, collectible enhancement layer on top of it.

1.6.3 Monkii Labs Product Surfaces and Visual States

The Monkii Labs interface should make the nurturing loop understandable before a user encounters any technical terminology. The laboratory metaphor is functional, not decorative: the Proof-of-Life card represents the heartbeat session, the Agent Status monitor represents operational vitality, the Rewards case represents earned participation, and the Companion tray represents the collectible ownership layer.

Surface or prop	Product meaning	Visual behavior
PROOF OF LIFE card	A lightweight verified heart-beat session	Red checkmark appears after a successful session; no fabricated score or transaction detail
AGENT STATUS monitor	Current operational state of the supported agent	Clearly shows THRIVING, IDLE, or FADING; power bar changes visually over time
NURTURE action	Starts a user heartbeat contribution	Single obvious action with immediate visual response
REWARDS case	Earned participation and the approved token loop	Opens only after verified work; avoids price charts and investment language
Companion tray	Equipped Solana Companion NFTs	Shows 1–3 equipped Companions beside the agent and their active bonus state
Neon activation chamber	Community-scale view of agent vitality	A dark platform, green beam, and glowing agent ring visualize collective support

The state system must remain legible: a neglected agent fades, a supported agent becomes idle or thriving, and the transition is shown through expression, aura, posture, and the power indicator. The visual system should never imply that a token price, a fabricated metric, or a speculative return is the source of agent health.

1.7 Goals

1.7.1 Core Platform Goals

- Close the sustainability, engagement, and visibility gaps in the agentic economy.
- Deliver a low-effort, emotionally resonant daily ritual for retail users.

- Build genuine, recurring utility for the existing \$VIRTUALS community.
- Keep the engineering footprint deliberately minimal (no smart contracts for the core game loop).
- Scale to thousands of users without heavy gas or complexity.

1.7.2 Companion NFT Goals

- Add a high-emotion, collectible layer that fits the Tamagotchi fantasy.
- Create real scarcity and secondary market potential.
- Give users meaningful reasons to hold and equip NFTs (not just cosmetics).
- Generate additional sinks for \$MONKII / \$VIRTUALS and new revenue opportunities.
- Keep the core architecture lightweight (minimal new on-chain surface area in v1).
- Drive higher retention, session length, and social sharing.

1.7.3 Non-Goals (v1)

- Full breeding / evolution system for Companions (Phase 2+).
- Complex on-chain game logic or heavy smart contracts for the core companion or nurturing loops.
- Replacing the existing nurturing or staking mechanics.
- Supporting non-Solana chains.
- Bootstrapping a brand-new token or community from zero.

1.8 Target Audience

Monkii Labs serves four distinct but interconnected groups:

Audience	Description	Primary Value
Retail Nurturers	Everyday crypto users and AI enthusiasts who want a low-effort, gamified way to participate in the agentic economy.	Gamified engagement, \$MONKII rewards, Companions, and a sense of ownership over the agents they support.
The \$VIRTUALS Community	Existing holders and community members around \$VIRTUALS, looking for real, ongoing utility beyond price speculation.	A concrete, recurring reason to hold and stake — an active utility loop grafted onto an existing token.
Agent Developers	Creators and teams who build AI agents (e.g. on Virtuals Protocol) and need reliable, community-backed operational support.	Decentralized “life support,” reduced operating burden, and a built-in, motivated community.
The Solana Ecosystem	Protocols, communities, and the broader Solana network seeking richer agent infrastructure and on-chain activity.	A resilient agent-support layer, increased real wallet activity, and a showcase of retail-friendly Solana utility.

1.9 Key Differentiators

Monkii Labs is positioned to stand apart from existing projects in the compute and AI-agent space along several dimensions:

- **Focus on maintenance, not creation** — Most projects focus on *creating* agents or providing raw, enterprise-grade compute. Monkii Labs is the first to focus squarely on the *decentralized, retail-driven maintenance* of agents.
- **Tamagotchi framing** — Transforms a technical activity into an emotionally engaging daily ritual, dramatically lowering the barrier to participation.
- **Compute Light architecture** — Requires no specialized hardware or technical expertise, making it accessible to a mass retail audience.
- **Minimal engineering footprint** — No on-chain smart contract layer for the agent registry, Proof-of-Life verification, or reward accounting. All of that lives in an off-chain database; Solana is touched only for wallet-signature authentication and final \$VIRTUALS settlement. The experience iterates as fast as a normal web app.
- **Builds on an existing community** — Rather than bootstrapping a brand-new token and community from zero, Monkii Labs builds directly on top of \$VIRTUALS, so the value-capture side has a real, existing audience from day one.
- **Collectible ownership layer** — Agent Companion NFTs add scarcity, secondary-market potential, and emotional attachment without turning the product into a full pet-breeding game.

1.10 Compute + Community Positioning

Monkii Labs is a **compute network with a community it didn't have to build from scratch**.

1.10.1 Compute Is the Product

The core unit of value creation is the Proof-of-Life heartbeat session — a lightweight, verifiable compute contribution performed by ordinary users that sustains an agent's power and operational vitality. The entire interface is organized around this act: the agent avatar visualizes the result of compute, the live power meter quantifies it, the Nurture button initiates it, and the dashboard records each user's contribution over time. Remove the tokens entirely and Monkii Labs would still be a coherent product — a community keeping agents alive through distributed compute.

1.10.2 Community Is the Multiplier

Where the compute mechanic drives daily engagement, the \$VIRTUALS community is what gives that engagement an audience and a reason to spread. Nurtureurs aren't just contributing compute into a void — they're doing it as part of, and visibly connected to, a community that already has its own identity, momentum, and distribution. Staking \$MONKII to earn \$VIRTUALS is the bridge between the two.

1.10.3 The Tokens Serve the Loop, Not the Reverse

Two tokens do two different jobs:

- **\$MONKII** is the receipt for real compute work — earned exclusively through verified heartbeat sessions and the unit that gets staked.
- **\$VIRTUALS** is the value-capture asset — staked \$MONKII earns it on a fixed, transparent schedule. Every \$VIRTUALS paid out is sent directly to the user's wallet by the platform's pool wallet (which pays the network fee).

Neither token is issued for merely holding, trading, or speculating in isolation — both flow from genuine participation.

1.10.4 Relationship to the Broader Solana Compute & Agent Meta

Monkii Labs sits deliberately within the decentralized-compute and AI-agent narratives that are among the dominant themes in the Solana ecosystem, but occupies a distinct, underserved niche: the *ongoing maintenance* of agents through retail-accessible, “Compute Light” contributions, rather than the creation of agents or the supply of raw compute. Layering this on top of an established community-aligned token layer turns that niche into something with day-one distribution rather than a cold start.

1.11 The \$MONKII / \$VIRTUALS Tokens: Utility and Value Capture

1.11.1 Two Tokens, Two Jobs

\$MONKII is the participation receipt for verified nurturing activity. It is earned through successful Proof-of-Life heartbeat sessions and is the unit that users stake inside the Monkii Labs loop.

\$VIRTUALS is the value-capture asset earned through the approved Monkii Labs staking path. The relationship is intentionally simple for users to understand: contribute verified support, earn \$MONKII, then stake \$MONKII to earn \$VIRTUALS according to the project’s defined schedule.

The document does not invent a contract address, market status, price, APY, payout amount, or launch date. Those details should be added only after they are formally approved and verified.

1.11.2 Transparent Reward Logic

The reward experience should communicate a predictable, transparent cycle rather than a continuous speculative feed. The interface may show a shared countdown, eligibility state, or completed cycle indicator, but it must not fabricate numbers. Staking or unstaking rules, minimum balances, payout timing, and any caps must be finalized in the economics specification before they are presented as live product behavior.

1.11.3 The Sustainable Loop

flowchart LR

```
A["Nurture: Proof-of-Life heartbeat"] --> B["$MONKII earned"]
B --> C["Stake $MONKII"]
C --> D["Defined $VIRTUALS reward"]
D --> E["More reason to keep nurturing"]
E --> A
F["Companion ownership"] --> A
G["Community support"] --> A
```

The tokens serve the nurturing loop, not the reverse. The product remains coherent without speculative framing because the underlying value creation is the community’s lightweight, verifiable effort to keep autonomous agents operational.

1.11.4 Communication Guardrails

All public-facing copy should use the exact phrase **“Stake \$MONKII. Earn \$VIRTUALS.”** Do not describe either token as guaranteed profit, passive yield without participation, a price prediction, or a financial product. Do not show fabricated charts, balances, market caps, APY, or token-price movement in the Monkii Labs interface or marketing materials.

1.12 Agent Companion NFTs — Functional Requirements

1.12.1 Core Concept

Every agent can equip **1–3 Companions** (exact number configurable). Companions are Solana NFTs that live alongside agents, provide meaningful gameplay bonuses, create emotional attachment, and open a speculative secondary market — all while reinforcing the core nurturing loop.

1.12.2 User Stories

1. As a nurturer, I want to equip a Companion to my agent so that I receive meaningful bonuses and feel a stronger emotional connection.
2. As a collector, I want rare Companions that look unique and provide stronger bonuses so that I have status and speculative upside.
3. As a user, I want to easily equip, unequip, and view my Companions from the agent detail page and dashboard.
4. As a top nurturer, I want exclusive or early access to rare Companions as a reward for consistent care.
5. As a trader, I want to buy and sell Companions on major Solana marketplaces.

1.12.3 Companion Types & Rarities (v1 Proposal)

Rarity Tiers

- Common
- Uncommon
- Rare
- Epic
- Legendary

Example Companion Categories (can be expanded)

- Spirits / Energy orbs
- Small creatures
- Weapons / tools
- Mystical objects
- Abstract life-force entities

Each Companion has:

- Unique name + artwork
- Rarity
- One primary bonus
- Optional visual effect when equipped

1.12.4 Gameplay Bonuses

Companions provide passive benefits while equipped:

Rarity	Example Bonus Range	Additional Effects
Common	+5–10% \$MONKII earn rate	—
Uncommon	+10–15% \$MONKII earn rate	Minor fade protection
Rare	+15–25% \$MONKII earn rate	Moderate fade protection
Epic	+25–35% \$MONKII earn rate	Strong fade protection + visual aura
Legendary	+35–50% \$MONKII earn rate	Strong protection + unique ability

Unique Legendary abilities (examples)

- “Never fully fades” (agent stays at least Idle)
- “Double nurture reward once per day”
- “Bonus \$VIRTUALS claim multiplier”

Bonuses only apply while the Companion is equipped to an active agent the user is nurturing.

1.12.5 Acquisition Methods

- **Free / Reward mints:** Milestone rewards (e.g. 7-day thriving streak, top leaderboard placement).
- **Paid mint:** Limited waves priced in SOL or \$VIRTUALS.
- **Secondary market:** Fully tradeable on Magic Eden, Tensor, etc.
- **Future:** Possible craft / fusion (Phase 2).

1.12.6 Equip / Unequip Flow

- User can equip up to 3 Companions per agent (configurable).
- Equip/unequip is instant and free (or very low cost).
- Visual update happens immediately on the agent avatar.
- Dashboard and agent detail page clearly show equipped Companions and active bonuses.

1.12.7 Visual & UX Requirements

- Companions appear next to or attached to the agent avatar.
- Companion expression or animation can react to the agent’s current state (thriving / idle / fading).
- Clean inventory view of all owned Companions.
- Clear indication of which bonuses are currently active.
- Mobile-friendly equip flow.

1.12.8 Ownership & Trading

- Companions are standard Solana NFTs (preferably compressed NFTs / cNFTs for cost efficiency).
- Fully transferable.
- Metadata should include rarity, bonus type, and any special traits.

1.12.9 Non-Functional Requirements (Companions)

- Equip/unequip and bonus calculation should feel instant.
- Core companion logic (which companions are equipped and what bonuses they give) can live off-chain in v1 for speed of iteration.
- Actual NFT minting and ownership must be on-chain.
- System must scale to thousands of users without heavy gas or complexity.
- Artwork must feel cohesive with the existing Monkii Labs visual language.

1.12.10 Technical Approach (Companions — Recommended v1)

Hybrid model

- Companion NFTs are real on-chain assets (minted via Metaplex / Bubblegum for cNFTs).
- Equipping and bonus application is tracked off-chain in the Monkii Labs database (linked by wallet + mint address).
- This keeps the core game loop fast and iterable while still giving users real, tradeable ownership.

Future upgrade path

- Move equipping and dynamic metadata fully on-chain if desired.
- Add dynamic NFTs that visually update with agent state.

Key dependencies

- Solana NFT standard (cNFT preferred)
- Existing wallet authentication
- Current agent power and \$MONKII accounting systems

1.12.11 Tokenomics & Economy Impact (Companions)

Sinks created

- \$MONKII or \$VIRTUALS spent on paid mints
- Potential future costs for upgrading or fusing Companions

Value accrual

- Stronger reason to hold and equip NFTs
- Secondary market royalties (if enabled)
- Higher engagement → more \$MONKII earned and staked → more \$VIRTUALS demand

Revenue opportunities

- Primary mint sales
- Secondary market royalties
- Future premium Companion drops

1.13 High-Level System Architecture

Monkii Labs is composed of three cooperating layers, deliberately kept as light as possible: no smart contract is deployed or audited for the core game loop, and Solana is touched only where real value or identity is actually at stake.

Client Layer (Web App)

- Landing page, marketplace, agent detail pages, user dashboard, leaderboard, registration flow, and notification surfaces.
- Proof-of-Life heartbeat solver (Web Worker performing the same keccak256 proof-of-work the back-end verifies).
- Companion inventory, equip/unequip UI, and visual integration on agent avatars.

Application & Service Layer (Express API)

- Typed REST API coordinating agents, sessions, power accounting, the staking/epoch reward engine, notifications, and a key-gated admin tool.
- Off-chain tracking of equipped Companions and active bonuses (linked by wallet + mint address).

Chain & Integration Layer

- Solana wallet-signature authentication (Ed25519, no gas, no transaction).
- Reading real on-chain balances for pool transparency.
- Disbursing real \$VIRTUALS transfers from the pool wallet on claim.
- Companion NFT minting and ownership (Metaplex / Bubblegum cNFTs preferred).
- Integrations with Virtuals Protocol (real agent data) and Telegram (power-drop push alerts).

flowchart TB

```

    subgraph Client["Client Layer (Web App)"]
        UI["Landing - Marketplace - Agent Detail - Dashboard - Leaderboard - Registration - Companion Inventory"]
        Heartbeat["Proof-of-Life Heartbeat Solver (Web Worker)"]
    end

    subgraph App["Application & Service Layer (Express API)"]
        API["Typed REST API"]
        Power["Power Accounting"]
        Rewards["Staking + $VIRTUALS Epoch Reward Engine"]
    end
  
```

```

    Companions["Companion Equip / Bonus Tracking (off-chain)"]
    Notify["Notifications (Power-Drop Alerts)"]
    Admin["Admin Tool (key-gated $MONKII airdrop)"]
end

subgraph Chain["Chain & Integration Layer"]
    Auth["Solana Wallet Signature Auth"]
    Pool["Pool Wallet: real $VIRTUALS disbursement + balance reads"]
    NFT["Companion NFT Minting & Ownership (cNFT)"]
    Virtuals["Virtuals Protocol (real agent data)"]
    Telegram["Telegram Bot (push alerts)"]
end

UI --> API
Heartbeat --> API
API --> Power
API --> Rewards
API --> Companions
API --> Notify
API --> Admin
API --> Auth
Rewards --> Pool
Companions --> NFT
API --> Virtuals
Notify --> Telegram

```

This separation keeps the user-facing experience fast and iterable, concentrates real value movement in one narrow, auditable path (the pool wallet + NFT ownership), and lets the platform integrate cleanly with external systems without coupling them to the core nurturing logic.

1.14 Success Metrics

1.14.1 Core Platform (First 90 Days Post-Relevant Launch)

Metric	Target / Approach	Notes
Active nurturers	Track & grow	Daily / weekly active users performing heartbeat sessions
Agents with positive power trend	Track	Health of the agent ecosystem
\$MONKII earned & staked	Track	Engagement depth
\$VIRTUALS claimed	Track	Value-capture activity
Retention (D7 / D30)	Measurable positive	Core loop stickiness

1.14.2 Companion NFTs (First 90 Days)

Metric	Target	Notes
% of active agents with ≥ 1 Companion	>40%	Adoption
Average Companions equipped per user	>1.2	Depth of engagement
Secondary market volume	Track	Speculative interest
Retention lift for Companion owners	Measurable positive lift	Core value proof
\$MONKII / \$VIRTUALS spent on mints	Track	Economic activity
Social shares of Companion + Agent	Track	Virality

1.15 Roadmap

1.15.1 Twelve-Month Platform Roadmap

Quarter	Theme	Key Milestones
Q1	Foundation & MVP	Product spec, Liquid Glass web shell, Solana wallet auth, Agent Registry on devnet, pilot agents.
Q2	Proof-of-Life Live	Heartbeat sessions, \$MONKII minting, expressive agent avatars, marketplace, personal dashboard.
Q3	Staking Bridge	\$MONKII → \$VIRTUALS staking, revenue-funded buybacks, leaderboard, X activity feed per agent.
Q4	Scale & Ecosystem	Mainnet launch, agent-launch partner integrations, notifications, mobile companion.

1.15.2 Companion NFT Phased Rollout

Phase 1 – MVP

- 5–8 distinct Companion designs across Common → Rare
- Basic equip/unequip
- Passive \$MONKII earn rate bonuses
- Free milestone rewards + limited paid mint
- Visual integration on agent avatars
- Inventory and dashboard views

Phase 2

- Epic & Legendary tiers + unique abilities
- Stronger visual effects and state reactions
- Expanded acquisition methods
- Improved collection / showcase UI

Phase 3

- Companion leveling or simple upgrades
- Possible light fusion / evolution
- Dynamic metadata
- Deeper integration with leaderboards and social features

1.16 Risks & Mitigations

Risk	Mitigation
Companions feel purely cosmetic	Strong, meaningful bonuses from day one
Low Companion adoption	Generous free / reward mints for early users
Artwork quality inconsistency	Strict art direction and limited initial set
Secondary market fails to form	Focus on utility + scarcity + emotional design
Scope creep into full pet game	Keep Companions as enhancement layer only
Core loop feels too thin without ownership	Ship Companions as the natural collectible layer once the nurturing experience is stable
Over-reliance on a single token community	Maintain clear compute-first positioning; \$VIRTUALS is the multiplier, not the product

1.17 Open Questions

1. Exact number of Companions allowed per agent (1, 2, or 3)?
2. Preferred initial rarity distribution and supply caps?
3. Should paid mints accept \$VIRTUALS, SOL, or both?
4. How aggressive should free milestone rewards be in the beginning?
5. Do we want Companion bonuses to also affect \$VIRTUALS claim rates later?
6. Preferred visual style direction for Companions (cute, mystical, cyber, abstract)?
7. Timing of Companion Phase 1 relative to core platform Q2/Q3 milestones?

1.18 Dependencies**Core Platform**

- Solana wallet authentication
- Virtuals Protocol agent data
- Existing agent state and reward systems
- Pool wallet for \$VIRTUALS disbursement

Companion NFTs

- Final art direction and initial Companion designs

- Decision on cNFT vs standard NFT
 - Wallet connection and user inventory infrastructure
 - Marketplace listing readiness (Magic Eden / Tensor)
 - Integration with current agent power and \$MONKII accounting systems
-

1.19 Summary

Monkii Labs reframes the unglamorous necessity of keeping AI agents alive as a friendly, community-driven ritual on Solana. The product combines a Tamagotchi-inspired interaction model, a Compute Light Proof-of-Life mechanic, visible agent states, transparent contribution accounting, the approved **\$MONKII → \$VIRTUALS** reward path, and a collectible Companion layer.

The Monkii Labs brand makes the technology approachable without hiding its structure. The bright laboratory explains the action. The Proof-of-Life card explains the heartbeat. The Agent Status monitor explains the consequence. The neon activation chamber shows the community effect. The Rewards case and Companion layer give the user a reason to return, while the system remains grounded in participation rather than unsupported speculation.

Compute is the product that makes the experience honest. Community is the multiplier that gives the experience life. Companions are the ownership layer that turns daily care into lasting attachment.

This document is a working product and systems reference. Any token mechanics, contract details, market claims, launch dates, or quantitative targets must be verified in the relevant approved specification before public release.

Document Control

This is a living document. Updates will be versioned. Approval of the current revision is required before art production, engineering kickoff, public token claims, or major platform milestones.
